Animal Systems Quiz

The following passage describes animal systems. Fill in the blanks with the correct word or phrase.

Animals are complex organisms with many interacting parts, which biologists organize in a _____. Specialized cells are grouped together into a _____, two or more types of which combine to make an _____ (such as the heart). _____ are groups of organs that work together to perform basic functions, such as reproduction.

Animals have four major types of tissue. _____ consists of thin sheets of tightly packed cells that covers surfaces and lines internal organs which protects what it covers. _____ consists of cells and fibres held together by non-living material called the matrix. It acts to support the organism. _____ consists of long bundles of cells that can contract (shorten). The animal needs this to move. Finally, _____ consists of bundles of cells that can carry electrical signals, which the animal needs to sense and respond to the environment.

Animal Systems Quiz

The following passage describes animal systems. Fill in the blanks with the correct word or phrase.

Animals are complex organisms with many interacting parts, which biologists organize in a hierarchy. Specialized cells are grouped together into a tissue, two or more types of which combine to make an organ (such as the heart). Organ systems are groups of organs that work together to perform basic functions, such as reproduction.

Animals have four major types of tissue. Epithelial tissue consists of thin sheets of tightly packed cells that covers surfaces and lines internal organs which protects what it covers. Connective tissue consists of cells and fibres held together by non-living material called the matrix. It acts to support the organism. Muscle tissue consists of long bundles of cells that can contract (shorten). The animal needs this to move. Finally, nerve tissue consists of bundles of cells that can carry electrical signals, which the animal needs to sense and respond to the environment.

Digestive System Quiz

The following passage describes the digestive system. Fill in the blanks with the correct word or phrase.

The digestive system is the organ system that takes in food, digests it and absorbs its nutrients, and excretes the remaining material as waste.

The digestive tract is a long tube running through the body. Food enters at the mouth, where it is chewed and softened by enzymes in the saliva. After it is swallowed it passes through the esophagus to the stomach, where it is churned by muscles and digested by acids and enzymes. Once the food has been broken down it passes into the small intestine, where nutrients diffuse through the walls and into the blood stream. After the nutrients are extracted the food passes into the large intestine (or colon), which absorbs water. The remaining solid waste is excreted from the anus as feces.

Other organs also help digest our food. The liver produces bile, which helps break down fats. The pancreas produces insulin, which controls the level of glucose in our blood.

B2.1

use appropriate terminology

Circulatory System Quiz

The following passage describes the circulatory system. Fill in the blanks with the correct word or phrase.

The circulatory system is the organ system that transports substances around the body. It has three main parts.

The blood is a type of connective tissue. Its colour comes from red blood cells, which carry oxygen to other cells in the body. Infections are fought by white blood cells. Tiny cells called platelets help blood clot (to stop cuts from bleeding). All of these cells are carried in plasma.

The heart is the organ that pumps blood around the body. It is made of three types of tissue. cardiac muscle tissue contracts to pump blood. It is controlled by nerve tissue, and covered with a smooth layer of epithelial tissue that protects the heart and help blood flow smoothly.

Blood is carried through the body in three types of blood vessel. Arteries carry blood away from the heart. They have thick walls to withstand pressure. Veins carry blood towards the heart. capillaries are tiny blood vessels with very thin walls so oxygen and nutrients can diffuse through them.

Musculoskeletal System Quiz

The following passage describes the musculoskeletal system. Fill in the blanks with the correct word or phrase.

The musculoskeletal system is the organ system that provides support and locomotion to the body.

Your skeleton is made of three different types of _____. _____ is hard and dense; it is made of bone cells surrounded by a matrix of minerals and collagen fibres. Bones are held together by _____, which are strong connective tissue made of long collagen fibres.

_____ provides a smooth surface at joints, protecting the bones and making movement easier.

Your body has three types of muscle tissue, which is made of bundles of long cells called _____. The smooth muscles in your intestines and the cardiac muscle in your heart are involuntary muscles: they are not under conscious control. The striated muscles attached to your skeleton are voluntary muscles: they are used for movements like walking that you choose to do.

_____ are attached to your bones with _____. They work in pairs; when one muscle _____ to move a bone, the opposing muscle relaxes.
